Question 10.13.1.19

The probability that a non leap year selected at random will contain 53 sundays.

Solution: A non-leap year has 365 days, and a week has 7 days. Using the modulo operator, we can calculate the number of weeks and the remaining days as follows:

$$\text{no. of remaining days} = 365 \pmod{7} = 1. \quad (1)$$

$$\text{no. of weeks} = \frac{365 - 1}{7} = \frac{364}{7} = 52. \quad (2)$$

Therefore, a non-leap year has 52 weeks and 1 day in total.

$$\implies 52 \text{ sundays} \quad (3)$$

Let X denote the day of a week.

$$p_X(k) = \frac{1}{7} \quad \text{for } \{1 \leq k \leq 7\} \quad (4)$$

Hence probability of the extra day being a sunday is

$$p_X(1) = \frac{1}{7} \quad (5)$$

TABLE 1: Representation of each value of X_i

Parameters	Values	Description
X_i	1	Sunday
	2	Monday
	3	Tuesday
	4	Wednesday
	5	Thursday
	6	Friday
	7	Saturday
